

Assignment 3

Student Number: F24040229

Student Name: Ahmod Abdullah

My Work:

The screenshot shows an IDE with a project named 'untitled'. The project structure includes folders for 'gradle', 'idea', 'build', 'src', and 'main'. The 'main' folder contains a 'StringConvert' class. The code in 'Main.java' is as follows:

```
1 package org.example;
2
3 class StringConvert {
4     public static void main(String[] args) {
5         String input = "hello1234";
6         StringBuilder result = new StringBuilder();
7
8         for (int i = 0; i < input.length(); i++) {
9             char ch = input.charAt(i);
10
11             // If letter - convert to uppercase
12             if (Character.isLetter(ch)) {
13                 result.append(Character.toUpperCase(ch));
14             }
15
16             // If digit - increase by 1
17             else if (Character.isDigit(ch)) {
18                 int digit = ch - '0';
19                 digit = digit + 1;
20                 result.append(digit);
21             }
22             // Other characters (just in case)
23             else {
24                 result.append(ch);
25             }
26         }
27     }
28 }
```

The Run console shows the following output:

```
Run: org.example.StringConvert.main()
✓ org.example.StringConvert.main(): successful At 4/26/2026 5:05 PM 956 ms
> Task :processResources NO-SOURCE
> Task :classes
> Task :org.example.StringConvert.main()
Original: hello1234
Converted: HELL02345
BUILD SUCCESSFUL in 838ms
2 actionable tasks: 2 executed
Consider enabling configuration cache to speed up this build: https://docs.gradle.org/9.2.0/userguide/configuration_cache_enabling.html
5:05:20 PM: Execution finished 'org.example.StringConvert.main()'.
```
